

PMS-SEX – Model Specification

A PMS-conform application profile (overlay) for sexuality: structural legibility of scenes, frames, drift, viability, sexual cost topology, Dignity-in-Practice, MIP docking, and the Δ - Ψ operator chain without person-typing, diagnosis, moral ranking, maturity ranking, adulthood verdicts, or how-to guidance.

Version: PMS-SEX_1.2 · Spec basis: PMS-SEX.yaml

Last updated: 2026-05-24 · Language: EN · Status: application_overlay

Author: T. Zöller · Formalisation assistance: ChatGPT (GPT-5.5 Thinking)

Depends on: PMS.yaml (schema_version = "PMS_1.3")

Repo: <https://github.com/tz-dev/PMS-SEX>

1. Purpose and status of this specification

This document specifies the *PMS-SEX* application profile in a concise, technical, human-readable form. It is based on PMS-SEX.yaml (schema_version = "PMS-SEX_1.2") and renders its identity, constraints, overlay concepts, reduced signatures, drift markers, sexual cost topology, viability criteria, Dignity-in-Practice discipline, MIP-docking boundary, and application firewall explicit for repo, paper, and computational use.

PMS-SEX is a **paper-specific application profile** of the Praxeological Meta-Structure (PMS). It operationalizes the structural lens of the accompanying paper:

Source paper updated paper reference

PMS-SEX — From Impulse to Self-Binding: A Praxeological Grammar of Sexuality (Δ - Ψ)

The profile is an **overlay**, not a fork, replacement, or extension of PMS. Its function is to make the sexuality lens formally legible while remaining strictly subordinate to the canonical PMS repository reference specification.

PMS-SEX does not redefine PMS operators, dependencies, derived axes, or meta-axioms. It uses the canonical operator grammar $\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$ to read sexual praxis as enacted configuration under frame, non-event, attractor formation, asymmetry, temporality, recontextualization, distance, integration, and self-binding.

Publicness, outer legibility, pre-reflective readability, path-cost, stabilization burden, body remainder, sexual cost topology, EDEN/PFO asymmetry-switch reference, asymmetry-switch drift, parity-to-exit, responsibility-to-authority, adult sexual reciprocity, and asymmetry-specific responsibility are **application-level overlay handles**. They are not PMS operators, not new axioms, and not alternative dependency graphs.

Core idea overlay discipline

PMS-SEX remains valid by staying within what it can responsibly say: not what persons are, but what configurations do over time. It permits hard claims about cost, drift, outer legibility, sexual cost topology, D-in-Practice stress, and consequence without converting those claims into person-status judgments, diagnosis, maturity ranking, adulthood verdict, or dignity hierarchy.

2. Relationship to PMS: non-negotiable constraints

2.1 Dependency statement

PMS-SEX depends on the canonical PMS base specification: `PMS.yaml ( schema_version = "PMS_1.3" )`.

2.2 Conformity constraints

- PMS-SEX does **not** redefine, replace, reinterpret, or extend the eleven PMS meta-axioms.
- PMS-SEX does **not** introduce new operators, meta-axioms, or dependency relations.
- PMS-SEX does **not** modify canonical operator order, dependency hygiene, or derived axes A , C , R , E , D .
- All references to Δ - Ψ retain their meanings exactly as defined in `PMS.yaml`.
- Apparent deviations such as reduced signatures, publicness overlay, outer legibility, path-cost, suspended Ψ attribution, sexual cost topology, asymmetry-switch drift, parity-to-exit, and responsibility-to-authority are shorthand or application-level descriptions only.
- PMS-SEX may record operator profiles. It may not directly evaluate person-adulthood, rank maturity, diagnose persons, or create dignity hierarchies.

2.3 Conformity record

Field	Value	Meaning
status	conformant_overlay	PMS-SEX is an application overlay, not a PMS fork.
base_schema_version	PMS_1.3	Canonical PMS base version.
canonical_operator_spine	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \wedge \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi$ $\rightarrow X \rightarrow \Sigma \rightarrow \Psi$	Reference path used throughout PMS-SEX.
no_new_meta_axioms	true	No additional PMS-level axioms are introduced.
no_operator_redefinition	true	Operators retain canonical PMS meanings.
no_dependency_rewrite	true	No alternative operator graph is created.
no_derived_axis_rewrite	true	Derived PMS axes remain unchanged.
no_direct_adulthood_verdict	true	Maturity-relevant or adulthood-relevant evaluation belongs only to MIP docking.

2.4 PMS-SEX 1.2 additions as overlay handles only

Handle	Status	Discipline
Sexual cost topology	Scene-bound Ω/Θ cost layout.	Not a score, not a person measure, not a dignity measure, not a maturity measure.
EDEN/PFO asymmetry switch	Cross-domain reference to PMS-EDEN.	Names the sexual instantiation of a regime-level drift; not a PMS operator and not an authority claim.
Asymmetry-switch drift	Drift profile.	Unmarked Ω activation under real or invoked Ω/Θ pressure without marking, bounding, and re-binding into Σ/Ψ .
Parity-to-exit	Drift profile.	Parity rhetoric denies additional responsibility under unequal sexual cost topology.
Responsibility-to-authority	Drift profile.	Required self-binding under asymmetry is converted into control, protection entitlement, or frame authority.
Adult sexual reciprocity	Viability principle.	Unequal burdens need not be equalized; they must not be externalized.
Asymmetry-specific responsibility	Role-position responsibility handle.	Self-binding required by a role-position's cost, power, exposure, exit, and externalization profile.

Handle	Status	Discipline
Operator profile only	Discipline rule.	Operator profiles are not direct person-adultness verdicts, maturity rankings, diagnoses, or dignity rankings.

Dependency hygiene PMS_1.3 preserved

Reduced formulas are reading aids. They are not alternative dependency graphs. Any use of $\times$ presupposes Φ , θ , $\square$. Any use of Σ presupposes χ , Φ . Any use of Ψ presupposes Σ , θ , χ .

3. High-level structure of the YAML model

3.1 Top-level keys

Key	Description	Role in the profile
schema_version	Version identifier: PMS-SEX_1.2 .	Compatibility, citation, and file identity.
schema_meta	Model identity, authorship, repo, source paper, dependency on PMS.	Profile identity and inheritance statement.
pms_v13_conformity	Formal conformity block against PMS_1.3.	Non-redefinition guarantee and no-direct-adulthood-verdict guard.
validity_gate	Application entry condition: X + reversibility + D.	Application firewall, including PMS-SEX 1.2 prohibitions.
operator_reference	Fixed operator set, canonical order, dependencies, hygiene note.	Δ - Ψ reference spine.
references	PMS, PMS.yaml raw, MIP, MIP.yaml raw, PMS-EDEN reference.	Traceability and docking reference.
overlay_concepts	Internal framing, outer legibility, publicness, path-cost, body remainder, sexual cost topology, EDEN/PFO asymmetry switch, drift profiles, adult reciprocity, asymmetry-specific responsibility, and operator-profile-only rule.	Application-level concepts, not operators.
reduced_signatures	Chapter-specific shorthand signatures and formulas.	Paper and repo orientation keys; no dependency rewrite.
layer_separation	Internal / outer / public / temporal layer guards.	Misreading prevention.
disturbance_and_path_cost_guard	Allowed and forbidden use of path-cost / disturbance language.	Anti-person-ranking and anti-dignity-hierarchy guard.
drift_catalogue	Core dysfunction markers and dynamic drift chains.	Configuration-level drift semantics including the PMS-SEX drift triad.
viability	Functional minimums, warning signals, viability corridor, adult sexual reciprocity.	Non-normative governability criteria.
modulators	Non-operator weightings: $\square_0$, Ω_0 , Λ density, Θ stability, Φ habituation, X mode, publicness, and cost-topology sensitivity.	Path likelihood without person typing.
minimal_psychology_adapter	Ch. 20 structural self-check alarm.	Restricted alarm, not explanation, updated for switch drift and cost-topology rereading.
dignity_in_practice_module	PMS-derived D construct and PMS-SEX application formula.	Dignity constraint under Ω /X/ Ψ / Θ plus switch-drift guards.
mip_docking_interface	Optional interface to MIP critique context.	Operator-profile-only boundary and no direct adulthood verdict.
limits_and_extensions	Structural limits, exclusions, openness to remainder.	Scope discipline.
glossary_concepts	Appendix B terms, including PMS-SEX 1.2 additions.	Terminological consistency.
chapter_one_line_markers	Quote-ready chapter closure markers.	Paper-linked retrieval and citation support.

Key	Description	Role in the profile
structural_tools	Operator table and one-page structural map.	Analysis consistency tools.
analysis_checklist	S1–S12 scene-bound checklist.	Application protocol scaffold.
example_suite_schema	Required, optional, and forbidden blocks for examples.	Repo vignette schema.
final_profile_guard	Final constraint and compressed rules.	Profile-level closure.

Conceptual separation PMS vs PMS-SEX

PMS defines the operator grammar. PMS-SEX defines how that grammar is used to read sexual practice structurally: frames, asymmetries, sexual cost topology, non-events, repetition, trajectories, outer legibility, publicness, drift, viability, dignity-preserving critique, and MIP docking boundaries.

4. Validity gate and application firewall

The validity gate constrains PMS application only. PMS itself may be criticized, rejected, revised, or ignored without satisfying this gate. Any use of PMS-SEX as *PMS application* presupposes:

Requirement	Meaning	Invalid conversion prevented
X — Distance	Maintained meta-position and stop-capability; no fusion into verdict, urgency, enforcement, person-level attribution, role, impulse, asymmetry activation, parity claim, responsibility claim, or self-justifying rhetoric.	Using PMS-SEX as enforcement, accusation, urgency, authority, or role-fusion.
Reversibility	Scene-bound, configuration-specific, revisable readings; no global person labels, irreversible claims, identity verdicts, maturity verdicts, adulthood verdicts, or ontological attributions.	Turning a structural reading into a fixed person-label or rank.
D — Dignity-in-Practice	No shaming, humiliation, person-ranking, diagnosis, orientation taxonomy, maturity hierarchy, dignity hierarchy, or person-worth evaluation; critique targets enacted structures and cost handling only.	Converting cost, asymmetry, drift, or topology into degraded personhood.

4.1 Explicit PMS-SEX 1.2 prohibitions

- sexual_cost_topology_as_score
- asymmetry_switch_as_authority
- parity_to_exit_as_reciprocity
- responsibility_to_authority_as_care
- operator_profile_as_direct_adulthood_verdict
- outer_legibility_as_public_punishment_license
- path_cost_as_person_value
- disturbance_language_as_orientation_taxonomy

4.2 Self-binding and model hygiene

In line with PMS v1.3, any application that suspends **Distance (X)**, **Self-Binding discipline (Ψ)**, or **Dignity-in-Practice (D)** in order to enforce truth, clarity, authority, resolution, urgency, action, asymmetry activation, parity claims, or responsibility claims is formally invalid as PMS application, even if PMS terminology is retained.

4.3 PMS-SEX analysis status

- scene-bound
- configuration-specific
- structurally revisable
- non-psychological
- non-clinical
- non-diagnostic
- non-prescriptive
- non-moralizing
- non-person-ranking
- non-maturity-ranking
- dignity-preserving
- operator-profile-only where adulthood-relevant questions would require MIP docking

Key firewall X + reversibility + D

If the overlay is used to shame, rank, diagnose, humiliate, force action, produce irreversible person-level interpretation, score cost topology, turn responsibility into authority, or derive adulthood verdicts directly, it has already left PMS-SEX application validity.

5. Operator reference and dependency hygiene

5.1 Fixed operator set

PMS-SEX uses exactly the canonical PMS operator set:

Δ, ∇, □, ∧, A, Ω, θ, Φ, X, Σ, Ψ

5.2 Canonical order

Δ → ∇ → □ → ∧ → A → Ω → θ → Φ → X → Σ → Ψ

5.3 Dependency table

Operator	Depends on	PMS-SEX use note
Δ	[]	Difference makes scene distinctions legible.
∇	["Δ"]	Impulse introduces directional pressure.
□	["Δ", "∇"]	Frame constrains impulse into scene grammar.
∧	["□"]	Non-events become structurally active under expectation.
A	["Δ", "∇", "□", "∧"]	Attractors stabilize repeated scripts.
Ω	["A"]	Asymmetry distributes access, exposure, exit, responsibility, and cost.
θ	["Ω", "A"]	Temporality makes accumulation, trajectory, and exit realism visible.
Φ	["θ", "Ω", "□"]	Recontextualization changes framing without rewinding costs.
X	["Φ", "θ", "□"]	Distance enables stop-capability, meta-position, and non-fusion.
Σ	["X", "Φ"]	Integration holds contradictions without coercive simplification.
Ψ	["Σ", "θ", "X"]	Self-binding binds integrated trajectories over time.

Dependency hygiene note no shortcutting

Reduced signatures may foreground clusters such as $\Omega \rightarrow \theta$, $\Lambda \rightarrow A \rightarrow \Omega \rightarrow \theta$, or unequal Ω/θ burdens + explicit cost topology + X restraint + Σ/Ψ re-binding. Such foregrounding does not suspend, bypass, or reorder PMS dependencies.

6. Overlay concepts: non-operators, application-level only

PMS-SEX introduces overlay concepts that organize or amplify PMS operators. They do not replace PMS generativity, do not create new operators, and do not authorize person-typing, diagnosis, maturity ranking, adulthood verdicts, or dignity hierarchies.

Overlay concept	Definition	Guard
Internal Framing	How a scene is inhabited, narrated, or lived from within the configuration: as play, service, devotion, experimentation, intimacy, kink, discipline, restraint, authenticity, casualness, non-binding practice, or otherwise.	Internal framing may shape experience but does not by itself determine or erase outer structural form, sexual cost topology, or Ω/Θ consequence distribution.
Outer Legibility	The structurally readable action-form a scene presents under visible asymmetry, exposure, markedness, repetition, and consequence, whether or not internal framing confirms it.	Naming outer legibility does not imply person-ranking, diagnosis, moral verdict, denial of consent, public-punishment license, or total interpretation.
Pre-Reflective Scene Readability	Early or immediate scene-legibility of certain marked configurations before elaborate internal translation or justificatory narration.	Structural readability claim only; not psychology thesis, innocence theory, or license for person-ranking.
Publicness as Overlay	Frame-extension that distributes, amplifies, documents, repeats, or sedimentizes a scene's readability and consequences without necessarily generating the primary scene form.	Publicness is neither always the origin nor automatically irrelevant. It modifies the consequence field and can harden cost topology without replacing scene reconstruction.
Path-Cost / Stabilization Burden	Configuration-level language for operator-work required to keep a configuration coherent, reversible, non-coercive, and dignity-preserving under recurrence and temporality.	Path-cost, disturbance, entropy, deviation, and stabilization burden do not classify persons, diagnose identities, rank orientations, lower dignity, rank maturity, or authorize moral pathology.
Body as Non-Operator Remainder	The body is treated as a material remainder or consequence interface that forces visibility, irreversibility, and cost recognition without becoming a new PMS operator.	Body remainder is not a person-ranking device and not a biological taxonomy. It names material consequence capacity within configurations.
Sexual Cost Topology	Scene-bound distribution of bodily, temporal, exposure-related, reputational, binding-related, exit-related, publicness-related, and responsibility-related costs across sexual role-positions.	Not a score, not a person measure, not a dignity ranking, not a maturity ranking. PMS-SEX does not require equal costs; it requires that unequal costs not be externalized.
EDEN/PFO Asymmetry Switch	Cross-domain reference to PMS-EDEN. In PMS-SEX, the term names the sexual instantiation of a regime-level drift: parity is claimed for autonomy, status, access, or non-binding freedom, while asymmetry is activated for protection, cost, exposure, or responsibility.	PMS-SEX does not derive its sexual grammar from PMS-EDEN. The switch is not a new PMS operator and not an authority claim.
Asymmetry-Switch Drift	A drift pattern in which asymmetry is activated under real or invoked Ω/Θ pressure without being marked, bounded, and re-bound into Σ/Ψ .	Scene-level drift profile only. Not a person label, motive claim, maturity verdict, or moral accusation.
Parity-to-Exit	A drift pattern in which parity rhetoric is used to deny additional responsibility under unequal sexual cost topology.	Names equality-language functioning as responsibility displacement. Not a person essence claim and not a denial of autonomy or consent as frame conditions.
Responsibility-to-Authority	A drift pattern in which required self-binding under asymmetry is converted into control, frame authority, protection entitlement, or paternalistic governance.	Greater responsibility under asymmetry does not generate a right to control. Responsibility remains Ψ/X self-binding.
Adult Sexual Reciprocity	Structural viability principle: unequal burdens must not be externalized. Adult sexual reciprocity does not require equal burdens, identical role tasks, or symmetry of content.	Not a moral command, not a role prescription, and not a direct maturity verdict about persons.

Overlay concept	Definition	Guard
Asymmetry-Specific Responsibility	The self-binding required of a role-position by its own cost, power, exposure, exit, and externalization profile.	Must not become an essence claim, dignity hierarchy, maturity hierarchy, or global person diagnosis.
Cost-Topology Mismatch	A configuration-level mismatch between declared parity, autonomy, non-binding status, or mutuality and the actual distribution of bodily, reputational, exposure-related, publicness-related, exit-related, or responsibility-related costs.	Scene-bound structural marker only. Not a person-fault claim, maturity verdict, or dignity ranking.
Operator Profile Only	Discipline rule: unmarked Ω activation, weak X , missing Σ , Ψ externalization, parity-to-exit, responsibility-to-authority, and cost-topology mismatch are recorded as structural profiles.	Maturity-relevant evaluation belongs to MIP docking and must remain scene-bound, reversible, non-person-ranking, non-diagnostic, and D-preserving.

Publicness overlay $\square$ extension

Publicness primarily intensifies Ω and Θ , and interacts with $\square$, A , Λ , Ψ . It remains an overlay, not an origin claim and not a new operator.

7. Layer separation and misreading guards

Internal framing, outer legibility, public circulation, and temporal carryover may overlap, but must not be collapsed into one another.

7.1 Layer model

Layer	Question	Misreading prevented
Internal framing	How is the scene inhabited or named from within?	Assuming internal meaning is false, irrelevant, or total.
Outer legibility	What action-form is structurally readable under asymmetry, exposure, repetition, consequence, and time?	Letting internal labels erase enacted form or cost topology.
Publicness	Does visibility, documentation, circulation, reputation, or audience uptake modify consequences?	Treating publicity as either the whole problem or as irrelevant.
Temporal carryover	How does the scene continue across Θ ?	Claiming that later narration rewinds accumulation.

7.2 Guard list

- Understanding internal meaning does not erase external form.
- Naming outer legibility does not imply person-ranking, diagnosis, moral verdict, maturity verdict, or adulthood verdict.
- Publicity may amplify, distribute, document, or sedimentize readability without necessarily creating it.
- Practice labels do not by themselves settle outer structural form.
- Pre-reflective readability does not settle meaning, worth, blame, consent, or cost topology.
- Outer legibility does not authorize public accusation by itself.
- Publicness is an overlay, not the necessary origin of consequence.
- Internal framing may be real without being total.
- Sexual cost topology may be named only as scene-bound cost layout, not as score or person measure.
- Asymmetry activation must be marked, bounded, and re-bound where it occurs.
- Parity must not become exit from responsibility.
- Responsibility must not become authority.

Layer discipline non-collapse rule

A scene may be internally framed one way, externally readable another way, publicly circulated in a third way, and temporally carried in a fourth way. PMS-SEX does not collapse these layers and does not use any one layer to authorize person-ranking.

8. Disturbance and path-cost guard

PMS-SEX allows disturbance and path-cost language only as configuration-language. It is inadmissible when converted into person-language, diagnosis, humiliation, maturity ranking, dignity hierarchy, or orientation taxonomy.

8.1 Allowed language

- configuration-level entropy
- path-cost
- stabilization burden
- attractor pressure
- Θ -accumulation
- $X/\Sigma/\Psi$ -work required for governability
- neutral disturbance as perturbation-language
- cost-layout drift
- cost-topology mismatch
- asymmetry-specific self-binding burden

8.2 Forbidden conversions

- person-level pathology
- sexual-orientation taxonomy
- identity ranking
- clinical diagnosis
- moral pathology
- humiliation or degradation of persons
- using entropy-language to override D
- path-cost as person-worth
- cost topology as score
- asymmetry-specific responsibility as maturity hierarchy
- operator profile as adulthood verdict

Final path-cost guard configuration only

Disturbance-language is admissible only as configuration-language. The moment it becomes person-language, diagnosis, rank, orientation taxonomy, humiliation, maturity ranking, dignity hierarchy, or adulthood verdict, it leaves PMS-SEX.

9. Reduced signatures: paper-specific shorthand only

Reduced signatures are chapter-specific reading aids. They foreground local operator clusters but do not alter PMS v1.3 order, dependencies, or operator meanings. PMS-SEX_1.2 adds sexual cost topology, EDEN/ PFO sexual instantiation, asymmetry-switch drift, parity-to-exit, and responsibility-to-authority as overlay/ profile handles only.

9.1 Signature index

ID	Label	Raw signature	Use / guard
SEX_linear_spine	Linear operator spine / canonical PMS v1.3 flow	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$	Canonical orientation.
MF_1_2	Sexuality as Recurring Praxis Pressure	$\Delta \rightarrow \nabla \rightarrow \square$; early effective: $\square \rightarrow \Lambda \rightarrow A$	Early pressure and frame formation.
MF_3_2	Frame	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow (\Lambda) \rightarrow A$	Frame as scene grammar.
MF_4_2	Asymmetry / Sexual Cost Topology	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta$	Ω basis plus sexual cost topology as concrete Ω/Θ layout.
MF_5_2	Temporality	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta$	Accumulation and irreversibility.
MF_6_2	Exit Realism	$(\square \rightarrow \Lambda \rightarrow A) \rightarrow \Omega \rightarrow \Theta \rightarrow (X/\Sigma/\Psi)$	Transversal exit-realism cluster; not an alternative base sequence.
MF_7_2	Non-Event	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow (A) \rightarrow (\Omega/\Theta)$	Absence as active structure.
MF_8_2	Pattern Formation	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow (\Omega \rightarrow \Theta)$	Attractor and cost-axis emergence.
MF_9_2	Recontextualization	$\Delta \rightarrow \nabla \rightarrow \square_1 \rightarrow (\Lambda) \rightarrow A \rightarrow \Omega/\Theta \rightarrow \Phi \rightarrow \square_2$	Φ re-embeds an already temporalized and asymmetry-relevant structure.
MF_10_2	Distance	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow (\Lambda) \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X$	Stop-capability and meta-position.
MF_11_2	Integration	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma$	Contradiction handling.
MF_12_2	Self-Binding	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$	Trajectory binding.
MF_14_3	Modulators	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$	Full operatorial background for non-operator weightings.
MF_15_2	Deviance as Consequence Structure	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$; pulling arrows: $\Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta$	Configuration-level deviation, not person deviance.
MF_16_2	High-Risk / Extreme Practices	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$; pulling arrows: $\nabla \rightarrow \square \rightarrow \Omega \rightarrow \Theta$	Intensity under X limiter; no how-to or risk optimization.

ID	Label	Raw signature	Use / guard
MF_17_2	Suspended Self-Binding Boundary Configuration	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega$ $\rightarrow \Theta \rightarrow \emptyset \rightarrow X \rightarrow \Sigma \rightarrow \Psi$	Ψ is present as deliberately suspended attribution condition, not absent or removed.
MF_18_2	Dysfunctional Expressions and Destructive Dynamics	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega$ $\rightarrow \Theta \rightarrow \emptyset \rightarrow X \rightarrow \Sigma \rightarrow \Psi$; pulling arrows: $\Lambda \rightarrow A$ $\rightarrow \Omega \rightarrow \Theta$	Adds PMS-SEX drift triad as profile handles: switch drift, parity-to-exit, responsibility-to-authority.
MF_19_2	Functional Conditions and Warning Signals	$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega$ $\rightarrow \Theta \rightarrow \emptyset \rightarrow X \rightarrow \Sigma \rightarrow \Psi$; dominant interaction: $\Omega \rightarrow \Theta$	Viability under cost topology, X restraint, Σ/Ψ re-binding, and no drift triad.
D_pms_sex_application_formula_ch21_3	D-in-Practice application formula	D = explicit Ω + operative X + no covert Ψ demand under Θ + marked/bounded asymmetry activation + no parity-to-exit + no responsibility-to-authority	Application-side D compliance; canonical PMS-D remains [" Ψ ", "X", " Ω "].
sexual_cost_topology_signature_ch4_6	Sexual Cost Topology — Ω/Θ cost layout	Ω/Θ cost topology across bodily, exposure, reputational, binding, exit, publicness, and responsibility channels	Scene-bound cost layout; not a score, person measure, dignity measure, or maturity measure.
eden_pfo_sexual_instantiation_signature	EDEN/PFO Sexual Instantiation — asymmetry switch	real/invoked Ω/Θ pressure $\rightarrow$ asymmetry activation $\rightarrow$ marked/bounded/re-bound OR unmarked switch drift	Cross-domain overlay reference only; no new PMS operator.
adult_sexual_reciprocity_signature	Adult Sexual Reciprocity — non-externalization of unequal burdens	unequal Ω/Θ burdens + explicit cost topology + X restraint + Σ/Ψ re-binding $\rightarrow$ non-externalization	Does not require equal burdens; requires that unequal burdens not be externalized.

Suspended Ψ clarification Ch. 17

Suspended self-binding means Ψ is present as a deliberately suspended attribution condition. It is not absent, replaced, removed, or transformed into a new operator.

PMS-SEX 1.2 overlay clarification no operator expansion

Sexual cost topology, EDEN/PFO sexual instantiation, asymmetry-switch drift, parity-to-exit, responsibility-to-authority, adult sexual reciprocity, and asymmetry-specific responsibility are application handles. They do not modify the canonical PMS operator grammar.

10. Drift catalogue

Drift markers are configuration statements, not labels. Each marker means: *in this configuration...* They describe predictable structural consequences of operator constellations; they are scene-bound, revisable, non-diagnostic, and non-person-ranking.

PMS-SEX 1.2 drift expansion profile handles only

PMS-SEX_1.2 adds the sexual drift triad: **asymmetry-switch drift**, **parity-to-exit**, and **responsibility-to-authority**. These are drift profiles, not PMS operators, person labels, motive claims, maturity verdicts, or moral accusations.

10.1 Core dysfunction markers

Marker	Configuration statement	Typical indicators	Structural result / guard
Covert self-binding demand Ψ leak	Meaning and identity-relevant stakes enter a frame narrated as limited, suspended, local, casual, or non-binding.	Implicit expectations; jealousy as rule-substitute; meaning claims without explicit frame legibility; local enactments treated as identity proofs; non-binding language denying responsibility already accumulated.	Ψ becomes operative although suspension is asserted. Attribution is silently demanded while the frame cannot carry binding explicitly.
Asymmetry escalation Ω escalation	Asymmetry increases while remaining unacknowledged inside the frame.	Boundary testing; access pressure around time, body, availability, attention, or repair; power shifts without rule updates; uneven refusal, exit, fallout, definitional capacity, exposure, or publicness-related cost.	Ω becomes a steering variable rather than a governed structural layout.
Pseudo-symmetry	Equality rhetoric functions as a lid on cost description.	"We both want it," "it's equal," consent language, mutuality claims, or casual / non-binding language are used to block analysis of unequal exposure, after-costs, or Θ consequences.	Conflict becomes non-negotiable because Ω must not be named inside $\square$. This does not deny consent; it only says consent-language does not by itself settle cost distribution.
Non-event escalation Λ as steering	Absence becomes an active steering mechanism.	Withdrawal as leverage; devaluation through non-occurrence; silence, indeterminacy, "maybe," "later," or unmarked withholding inside expectation-bearing frames.	Λ shapes practice more than enactment; coordination shifts into interpretation and guessing rather than explicit frame work.
Attractor fixation A compulsivity	Stabilization flips into fixation.	Practice becomes non-substitutable; repetition replaces choice; frame breadth shrinks; alternatives lose attractiveness, availability, or recognizability; practice labels protect the route from re-reading.	A binds more strongly than intention.
Loss of distance X loss	The meta-layer collapses.	Stopping becomes practically unavailable; critique or hesitation is read as betrayal, attack, weakness, disloyalty, prudishness, or domination; humor, de-escalation, and outside view disappear.	Self-correction fails. Without X , drift cannot be intercepted early.
Temporal overload Θ accumulation	Costs accumulate faster than the frame can carry.	Exit fictions persist; collapse becomes abrupt; publicness documents or sedimentizes already active costs; non-binding language fails to account for bodily, reputational, exposure-	Exit collapse replaces orderly ending. Θ does not rewind, and A holds the configuration in place too long for low-cost exit to remain plausible.

Marker	Configuration statement	Typical indicators	Structural result / guard
		related, or binding-related overhang.	
Outer-form denial	Internal framing or later recontextualization blocks analysis of enacted form.	"It was play," "service," "authenticity," "devotion," "consent," or "casual" is used to end structural reading; outer legibility is treated as hostile, irrelevant, or merely public misunderstanding.	The scene loses its capacity to read itself. Internal meaning may be real, but it does not erase the action-form effective under asymmetry, exposure, repetition, publicness, and time.
Asymmetry-switch drift	Asymmetry is activated not as marked emergency or protection under real Ω/Θ overload, but as repeatable leverage, responsibility displacement, or unacknowledged Ψ externalization.	Vulnerability, exposure, bodily risk, reputation, or protection is invoked without marking activation as exceptional; parity language remains for access, autonomy, mutuality, or non-binding status; Σ/Ψ re-binding does not occur.	Asymmetry no longer reopens coordination; it replaces coordination. It preserves parity language while distributing costs asymmetrically.
Parity-to-exit drift	Parity rhetoric is used to deny additional responsibility under unequal sexual cost topology.	"It was mutual," "we are equal," "no one owes anything," "the other is autonomous," or "it was only casual" functions as exit rhetoric.	Parity ceases to bind reciprocity and becomes an exit from responsibility. The frame remains rhetorically equal while unequal Ω/Θ costs remain uncoordinated.
Responsibility-to-authority drift	Required self-binding under sexual asymmetry is converted into control, frame authority, protection entitlement, or paternalistic governance.	"Because I must protect, I may define"; "because asymmetry is real, I may govern the frame"; care becomes control; protection becomes governance; responsibility becomes ownership of the situation.	Responsibility stops functioning as Ψ/X self-binding and becomes authority. Greater responsibility under asymmetry does not generate a right to control.

10.2 Dynamic drift chains

Chain	Raw trace	Reading
Primary chain	Ψ leak $\rightarrow \Omega$ escalation $\rightarrow X$ loss $\rightarrow A$ fixation $\rightarrow \Theta$ overload $\rightarrow$ exit collapse	Once meaning and attribution become covert, Ω more easily becomes a steering variable inside $\square$. When X is not operational, the script hardens through A and temporal costs accumulate until the exit fiction breaks.
Secondary chain	internal-label capture $\rightarrow$ outer-form denial $\rightarrow$ publicness confusion $\rightarrow$ delayed cost recognition	Practice labels or self-description settle the internal story while enacted form remains structurally readable. Public reaction is then treated either as the whole problem or as irrelevant.
EDEN/PFO sexual drift chain	pseudo-symmetry $\rightarrow$ asymmetry-switch availability $\rightarrow$ unmarked activation / parity-to-exit / responsibility-to-authority $\rightarrow \Sigma/\Psi$ blockage $\rightarrow$ reciprocity erosion	Once parity language remains in place while real sexual cost topology is unequal, asymmetry may become selectively activatable. If activation is not marked, bounded, and re-bound into Σ/Ψ , reciprocity erodes without needing a person-label or motive theory.

11. Viability conditions and warning signals

Viability criteria describe when a configuration remains structurally governable under $\Omega/\Theta/\Lambda$, without systematic D violation, without exit fictions, without using internal labels to erase enacted form, and without replacing Ω -management by switch drift. They are criteria only: not advice, not how-to, not diagnosis, and not moral ranking.

11.1 Functional minimum conditions

ID	Minimum	Checks
explicit_omega_recognition	Ω must be nameable and regulable within the frame.	Cost, risk, access, exposure, uneven exit capacity, repair burden, reputational exposure, and sexual cost topology remain nameable.
explicit_sexual_cost_topology	Bodily, temporal, exposure-related, reputational, binding-related, exit-related, publicness-related, and responsibility-related costs are readable as scene-bound layout, not person score.	Non-delegable costs, denial/minimization/externalization, Θ sedimentation, asymmetry invocation, parity invocation, and responsibility-to-authority risk are nameable without dignity or maturity ranking.
theta_awareness	Consequences are treated as real: exit realism.	Frequency, repetition, after-effects, repair windows, accumulated bodily, reputational, exposure-related, publicness-related, and binding-related costs are not narratively reset.
stable_chi_capacity	X is operative, not ornamental.	Stop-capability, distance, meta-commentability, outer-form awareness, and switch-clarification remain possible without punishment or recoding as attack.
no_psi_substitution	No Ψ leak as the default carrier of stakes.	Sexual practice does not substitute for integration, self-worth, identity proof, relationship clarification, covert commitment tests, or Ψ externalization onto the other role-position.
lambda_tolerance_without_escalation	Λ can exist without becoming steering or coercion.	Pause, fatigue, unavailability, cancellation, hesitation, absence, and non-occurrence remain legible without becoming control, punishment, devaluation, possession, or interpretive guessing.
internal_framing_accountable_to_outer_form	Internal framing does not erase outer structural form.	Consent, play, devotion, service, casualness, authenticity, and practice labels may clarify internal occupation but do not end structural cost-layout analysis.
publicness_handled_as_overlay	Publicness modifies readability and consequence without being confused with their necessary origin.	Publicity is not treated as the sole origin of consequence and is not ignored where it amplifies, documents, repeats, sedimentizes, or intensifies Θ/Ω .
marked_bounded_rebound_asymmetry_activation	Asymmetry activation under real Ω/Θ burden must be marked, bounded, and rebound into Σ/Ψ .	Activation is explicit, bounded under Θ , linked to real Ω/Θ burden, reopens Σ coordination, permits Ψ re-binding, and does

ID	Minimum	Checks
		not become repeatable unmarked exception.
no_parity_to_exit	Parity language coordinates reciprocity rather than denying additional responsibility under unequal sexual cost topology.	Mutuality, autonomy, consent-language, and formal equality do not flatten unequal costs or replace role-specific responsibility.
no_responsibility_to_authority	Responsibility under asymmetry remains Ψ/X self-binding rather than control, protection entitlement, or frame authority.	Care does not become control; protection does not become governance; responsibility does not become frame ownership; additional responsibility does not generate a right to command.

11.2 Warning signals

ID	Label	Structural note	Indicators
phi_narrative_inflation	Φ narrative inflation	Φ substitutes for Σ .	Reframing covers costs; clarification and cost naming are replaced by re-description; later meaning claims erase prior action-form.
mono_frame	Narrowing of $\square$ alternatives	A monopolizes $\square$.	Only one frame works; alternatives are devalued or rendered impossible; practice labels protect the dominant frame.
omega_moralization	Ω moralization instead of regulation	Ω is handled ideologically, increasing pseudo-symmetry risk.	Guilt, entitlement, "if you loved me" logic, accusation-recoding, or purity logic replaces asymmetry regulation.
persistence_despite_structural_undercutting	Persistence despite clear structural undercutting	A + Θ overrun X.	Repetition continues despite bodily, reputational, binding-related, publicness-related, or D-violating costs.
theta_cost_externalization	Externalization of Θ costs	Θ costs are shifted asymmetrically through Ω layout.	After-costs concentrate in roles less able to refuse or redefine them; short-term relief stabilizes another role's cost burden.
outer_form_denial	Outer-form denial	X is weakened because the configuration cannot re-read itself.	Internal labels, consent-language, or practice labels settle all form; outer legibility is framed as moralistic, hostile, or misunderstanding.
publicness_confusion	Publicness confusion	Publicness is misread as origin or as nothing rather than as overlay.	Audience reaction replaces scene analysis, or documentation / circulation / reputation are ignored despite consequence amplification.
asymmetry_switch_drift	Asymmetry-switch drift	Unmarked Ω activation replaces Σ/Ψ coordination.	Activation appears under real or invoked Ω/Θ pressure but is not marked, bounded, linked,

ID	Label	Structural note	Indicators
			or re-bound.
parity_to_exit	Parity-to-exit	Parity rhetoric exits responsibility under unequal sexual cost topology.	Mutuality or autonomy language denies additional responsibility; formal equality flattens non-delegable or sedimented costs.
responsibility_to_authority	Responsibility-to-authority	Required Ψ/X self-binding is converted into control.	Care becomes control; protection becomes governance; responsibility becomes frame ownership.

11.3 Minimal viability corridor

□ explicit

- + Ω nameable
- + Θ realistic
- + X operative
- + Λ tolerable
- + Ψ handled
- (+ Σ reachable)
- + cost topology explicit
- + asymmetry activation marked / bounded / re-bound
- + no parity-to-exit
- + no responsibility-to-authority
- = structurally governable configuration

This corridor expresses structural governability only. It makes no moral claim, defines no normality threshold, and does not prescribe action. Internal framing accountability, publicness-as-overlay, sexual cost topology, switch-drift checks, and adult sexual reciprocity remain binding layer guards, not changes to PMS operator logic.

11.4 Adult sexual reciprocity

Principle non-externalization

Adult sexual reciprocity does not require equal burdens, identical role tasks, or symmetry of content. It requires that unequal burdens not be externalized.

Required	Not required	Guard
Explicit cost topology; marked and bounded asymmetry activation; Ψ re-binding after activation; Σ coordination; X restraint; no unmarked exception lever; no parity-to-exit; no responsibility-to-authority; Dignity-in-Practice.	Equal burdens; identical role tasks; symmetry of content.	Structural viability principle only: not a moral command, role prescription, or direct maturity verdict about persons.

12. Modulators

Modulators are praxeological, not psychological. They operate through frames, repetition, cost layouts, sexual cost topology, consequence interfaces, outer legibility, publicness overlays, and handling capacity rather than through motive narratives.

They do not add new operators. They weight the likelihood and dominance of existing operators within the canonical background:

$$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \Lambda \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$$

12.1 Central modulators

Modulator	Weights	Structural effect
$\square_0$ Early framing	Speakability, scene grammar, boundary clarity, internal naming, outer-form accountability, and whether cost topology can be named without moralization.	Strong $\square_0$ increases later frame stability. Weak $\square_0$ increases ambiguity, retroactive rewriting, implicit rules, pseudo-symmetry, or parity-to-exit.
Ω_0 Asymmetry calibration	How asymmetry is noticed, named, regulated, and re-bound across access, exposure, availability, bodily cost, reputational cost, publicness, exit, responsibility, and cost topology.	Well-calibrated Ω_0 enables explicit asymmetry management. Poor calibration raises pseudo-symmetry, switch-drift, parity-to-exit, or responsibility-to-authority risk.
Λ density	How often absence, delay, silence, cancellation, hesitation, non-occurrence, or pause becomes meaning-bearing under expectation.	High Λ density can make non-events steer the configuration more than explicit enactment.
Θ stability	How stable trajectories, memory, repetition, recovery windows, accumulation, documentation, and exit realism remain across time.	Unstable Θ increases cost externalization, delayed collapse, public sedimentation, and narrative rewind claims.
Φ habituation	How readily recontextualization becomes default explanation, reassurance, or reset narrative.	High Φ habituation can substitute for Σ and block cost-layout re-reading.
X mode	Whether distance is live, ornamental, delayed, punished, fused, or only available after the relevant moment.	Operative X keeps stopping, humor, meta-commentary, switch clarification, and outer-form reading available. Weak X increases drift risk.
Publicness intensity	Visibility, documentation, circulation, reputation, institutional legibility, audience uptake, and social comparison.	Publicness can intensify Ω/Θ , harden cost topology, and sediment consequences without becoming the necessary origin of the scene.
Cost-topology sensitivity	Whether bodily, temporal, exposure, reputational, binding, exit, publicness, and responsibility costs remain visible as topology.	Low sensitivity increases cost-topology mismatch, parity-to-exit, and externalization of unequal burdens.

12.2 Demarcation

- Modulators do not type persons.
- Modulators do not explain inner motives.
- Modulators do not add PMS operators.
- Modulators do not authorize maturity ranking, adulthood verdicts, or dignity hierarchy.
- They describe how scene conditions make some operator chains pull faster or more persistently.

13. Minimal Psychology as Structural Self-Check Adapter

Minimal psychology is a restricted structural self-check adapter. It is non-diagnostic, non-interpretive, scene-bound, reversible, and dignity-preserving. It outputs structural alarm only.

13.1 Purpose and boundary

Minimal psychology is not a psychological explanatory layer. It activates where drift markers from Chapter 18 and viability failures from Chapter 19 are already structurally legible, yet repetition continues unchanged because structural description alone no longer interrupts the path.

Boundaries

- no diagnosis
- no motive theory
- no person typing
- no identity ranking
- no moral evaluation
- no therapeutic method
- no conversion into clinical taxonomy
- no maturity ranking
- no person-level assignment of drift markers

If asymmetry-switch drift, parity-to-exit, or responsibility-to-authority is present, minimal psychology still does not explain the pattern psychologically. It asks only whether self-description, desire-language, non-binding language, or protection-language helps the configuration continue despite already visible cost topology.

13.2 Activation conditions

- Drift markers from Chapter 18 are present.
- Minimal viability conditions from Chapter 19 no longer restore correction.
- The configuration is still carried voluntarily and repeatedly.

Typical activation contexts

- Ψ leak has been named, but repetition continues.
- Ω costs are legible, but still accepted, switched, denied, or externalized.
- Θ damage is foreseeable, but stop-capability keeps failing.
- X exists formally, but is not enacted in time.
- Practice labels continue to block outer-form analysis.
- Publicness is blamed or ignored while the enacted configuration remains unchanged.
- Internal self-description becomes more elaborate while the operator chain narrows.
- Asymmetry activation is named but remains unmarked, unbounded, or unrebound.
- Parity language repeatedly exits responsibility under unequal cost topology.
- Responsibility language becomes control, protection entitlement, or frame authority.

13.3 Guiding question

What structural role is this desire playing in this configuration?

The colloquial form "Why do I really desire X?" is admissible only if immediately translated back into the structural question above.

Constraints

- hypothetical, not confessional
- targets pattern continuity, not inner truth
- tests whether desire-language or desire-orientation functions as a drift carrier
- returns attention to enacted form, cost layout, stop-capability, asymmetry handling, and accumulated consequence
- may not override outer legibility with a deeper self-story
- may not explain away switch drift, parity-to-exit, or responsibility-to-authority as personality, trauma, desire, or identity

13.4 Permitted warning hypothesis

In this configuration, desire-language may be functioning as a drift-maintaining mechanism rather than as play, exploration, negotiated intensity, bounded practice, or marked asymmetry activation.

This hypothesis does not explain desire. It is never confirmed psychologically. It is only structurally tested against enacted patterns: repetition, cost concentration, outer-legibility denial, loss of distance, asymmetry escalation, temporal overload, switch drift, parity-to-exit, and responsibility-to-authority.

13.5 Test criteria

ID	Label	Indicators
D_in_Practice_failure	Repeated D-in-Practice failure	Dignity-in-Practice repeatedly undermined; degradation-near or humiliation-form scripts appear without play-reversibility; outer-form naming blocked by internal labels; asymmetry intensified while denied.
theta_damage_despite_knowledge	Θ damage despite knowledge	Foreseeable harm is acknowledged, repetition continues, accumulation accelerates, exit fictions remain active, and asymmetry activation is treated as temporary while costs accumulate.
progressive_frame_narrowing	Progressive frame narrowing	Alternatives lose attractiveness or feasibility; one script dominates; practice labels shield against re-reading; asymmetry activation, parity rhetoric, or responsibility language becomes the default route.
desire_used_against_chi	Desire used against X	Desire is invoked to bypass stopping, hesitation, meta-commentary, frame analysis, cost topology, or markable / re-bindable asymmetry activation.
publicness_displacement	Publicness displacement	Public reaction is treated as the whole problem, or publicness is denied despite documentation, circulation, reputational exposure, sedimentation, or pre-existing cost topology.
switch_drift_carried_by_self_description	Switch drift carried by self-description	Asymmetry activation is repeatedly described as exception, need, protection, vulnerability, or overload, but not marked, bounded, and re-bound; parity denies responsibility; responsibility becomes control.

13.6 Output format

Output is invariant and minimal. No explanation is permitted.

- "In this configuration, drift persistence is present."
- "Structural self-correction is failing within the configuration."
- "Distance (X), frame clarity ($\square$), and Θ realism require reactivation."
- "Internal framing is no longer sufficient to settle the enacted structure."
- "Outer legibility and cost distribution require re-reading without person-ranking."
- "Asymmetry activation, if present, requires marking, bounding, and re-binding into Σ/Ψ ."

- "Parity language and responsibility language require re-reading against the sexual cost topology."

Chapter closure marker Ch. 20

Minimal psychology in PMS-SEX activates when drift persists despite clarity: it does not explain desire, it signals that repetition, accumulation, switch drift, and frame narrowing are no longer correcting themselves.

14. Dignity-in-Practice module

Dignity-in-Practice is a PMS-derived construct. Its canonical PMS formula remains $\Psi + X + \Omega$. PMS-SEX adds an application-side guard, not a revision of PMS-D.

14.1 PMS-SEX application formula

explicit Ω

- + operative X
- + no covert Ψ demand under Θ
- + marked/bounded asymmetry activation
- + no parity-to-exit
- + no responsibility-to-authority
- + outer-form readability preserved
- = D-in-Practice in PMS-SEX application

Θ appears as trajectory realism, and Σ appears as re-binding / coordination condition. Outer-form readability and sexual cost topology are PMS-SEX guards, not revisions of canonical PMS-D.

14.2 Principle

D applies in enactment, not as status. PMS-SEX has no entitlement to the person: no authority over motives, worth, identity, biography, orientation, body, desire, or what someone “really is.” PMS-SEX has only entitlement to D in enactment: restraint, respect, and non-degradation within the accepted frame.

14.3 Outer-form guard

Naming an externally readable humiliation-form, degradation-form, asymmetry-form, possession-form, control-form, exposure-form, or authority-form is not itself a violation of the anti-moral stance. The violation would lie in converting scene analysis into person-ranking, humiliation, diagnosis, identity verdict, maturity ranking, or moral contempt.

14.4 Reference case: “man as client”

This reference case is a clarification case, not an exclusive model. Its baseline: Ω is highly explicit; $\square$ is formalized; Ψ is intended to be suspended; publicness may appear as overlay; outer legibility remains possible; sexual cost topology remains active despite explicit framing.

Protection against unwarranted degradation is valid where

- frame is respected
- rules and boundaries are kept
- no boundary violation occurs
- no pressure beyond agreed asymmetry occurs
- no covert meaning demand appears
- no manipulation via withdrawal or post-hoc humiliation appears
- outer-form naming is not converted into person-shaming
- asymmetry is marked and governed rather than used as leverage
- responsibility remains self-binding and does not become authority

14.5 Critique language

Not justified where	Structurally legible where
---------------------	----------------------------

Not justified where	Structurally legible where
Frame respect is maintained; no D-in-Practice failure, Ω escalation, Ψ leak, unmarked asymmetry activation, parity-to-exit, responsibility-to-authority, or publicness weaponization occurs.	Ψ leak, Ω escalation, pseudo-symmetry, Θ consequence denial, outer-form denial, publicness weaponization / denial, asymmetry-switch drift, parity-to-exit, or responsibility-to-authority appears.

14.6 Critique markers

- **Ψ leak:** binding is introduced inside a frame that cannot carry binding cleanly.
- **Ω escalation:** Ω becomes a steering variable instead of a governed layout.
- **Pseudo-symmetry:** equality or mutuality rhetoric blocks asymmetry governance.
- **Irresponsibility under Θ :** foreseeable bodily, social, reputational, exposure, publicness, or binding costs are externalized.
- **Outer-form denial:** internal labels or recontextualization erase enacted form and cost layout.
- **Publicness weaponization or denial:** publicness is either used as punishment or denied as consequence amplifier.
- **Asymmetry-switch drift:** asymmetry activation is unmarked, repeatable, responsibility-shifting, or unrebound.
- **Parity-to-exit:** equality language exits responsibility under unequal topology.
- **Responsibility-to-authority:** responsibility becomes control, protection entitlement, or frame authority.

14.7 Asymmetries on both sides

Asymmetry does not imply one-sidedness. Both sides may face asymmetries, but in different channels.

- different costs
- different risks
- different exposures
- different exit margins and recovery conditions
- different capacities to define, refuse, publicize, repair, or absorb consequences
- different capacities to activate asymmetry
- different capacities to externalize costs through parity rhetoric
- different capacities to convert responsibility into authority

Adulthood in PMS-SEX is not maintained by symmetry fictions. It is maintained by explicit asymmetry management within the frame.

14.8 EDEN/PFO reference inside D

PMS-EDEN names the regime-level asymmetry switch. PMS-SEX reads its sexual instantiation. In sexual frames, real body-, exposure-, reputational-, publicness-related, and consequence-asymmetries may justify marked emergency activation because not all Ω/Θ costs can be carried symmetrically.

Legitimate where	Dignity-relevant drift where
Activation is marked, bounded, linked to real Ω/Θ burden, and re-bound into Σ/Ψ .	Activation is unmarked, repeatable, responsibility-shifting; parity denies additional responsibility; responsibility becomes authority.

14.9 Sexual cost topology inside D

PMS-SEX treats sexual costs as role-distributed and trajectory-sensitive. The relevant question is not whether both role-positions carry identical costs, but whether each position carries the self-binding required by its own cost, power, and externalization profile.

Asymmetry-specific responsibility scene-bound

Each role-position must carry the self-binding required by its own cost, power, exposure, exit, and externalization profile. This is not a hierarchy of adulthood. It is a scene-bound responsibility reading under Ω/Θ .

14.10 Guardrail

D remains protection-first. It can support critique of enacted structures, cost externalization, and dignity failure, but never humiliation, diagnosis, person-worth evaluation, maturity ranking, adulthood verdict, or dignity hierarchy.

Chapter closure marker Ch. 21

Dignity in sexual practice is not about who someone is, but about how asymmetry is carried: when stopping works, costs are named, asymmetry is re-bound, and responsibility does not become authority, critique is possible without humiliation.

15. MIP docking interface

MIP docking is optional. PMS-SEX explains how structures work; MIP explains when critique is legitimate. Docking the two adds accountability without turning operator profiles into person judgments.

15.1 Separation rule

PMS-SEX may record operator profiles and drift markers. It may not directly evaluate person-adulthood, assign maturity ranks, diagnose persons, or create dignity hierarchies. Any maturity-relevant evaluation belongs to MIP docking and must remain scene-bound, reversible, non-person-ranking, non-diagnostic, and D-preserving.

15.2 PMS-SEX records only

- unmarked Ω activation
- weak or defensive X
- missing Σ coordination
- Ψ externalization
- parity-to-exit
- responsibility-to-authority
- cost-topology mismatch
- repeated failure to mark, bound, and re-bind asymmetry activation

15.3 MIP may ask / must not ask

MIP may ask	MIP must not do
Whether a role-position carries asymmetry-specific self-binding; whether it carried the self-binding required by its cost, power, exposure, exit, and externalization profile.	Essence claim, dignity hierarchy, maturity hierarchy, global person diagnosis, person rank, adulthood verdict as person ontology, or moralized person-label.

15.4 Proper and improper MIP questions

Proper: In this scene, under this cost topology, did the role-position carry the self-binding made necessary by its own power, exposure, exit capacity, and externalization profile?

Improper: What kind of person does this?

15.5 No back-projection

- MIP must not import moral psychology into PMS-SEX’s descriptive layer.
- PMS-SEX must not smuggle evaluation as neutral description.
- Outer structural legibility at the PMS-SEX layer does not by itself authorize public critique.
- Higher path-cost or disturbance does not by itself establish immaturity, blame, pathology, or moral failure.
- Asymmetry-switch drift does not by itself establish person-adulthood failure.

15.6 MIP docking axes

Axis	Name	Meaning
A	Awareness	Structural awareness, not psychological insight.
C	Coherence	Stability over time under $\Theta + \Lambda + \square$.
R	Responsibility	Self-binding and consequence handling under $\Omega + \Theta$.
P	Power	Real agency, alternatives, and choice capacity.

A/C/R/P here are MIP docking axes for evaluative critique. They do not modify PMS-derived axes A, C, R,

E, D, introduce a new PMS primitive, or replace PMS operator derivation.

15.7 Mapping principle

PMS-SEX provides	MIP orders into
Ω layout; Θ trajectory; X operability; Ψ leakage; $\square$ stability; A fixation; Λ density; outer legibility; publicness overlay; asymmetry-switch drift; parity-to-exit; responsibility-to-authority; sexual cost topology.	What was realistically knowable (A); what held over time (C); who carried consequences (R); what alternatives existed (P).

15.8 IA box

Criterion	Question
T — Transparent	Was the asymmetry legible?
J — Justified	Was it grounded in a protected good or legitimate constraint?
TB — Time-bound	Was it limited and reviewable?
R — Reversible	Were correction and exit pathways structurally available?

PMS-SEX use of IA

- distinguish legitimate deviation from inadult asymmetry patterns
- differentiate systemic abuse from frame-consistent asymmetry
- prevent pseudo-symmetry rhetoric from replacing real asymmetry accounting
- prevent public outrage from replacing asymmetry analysis
- prevent internal labels from settling outer form
- distinguish marked/bounded asymmetry activation from asymmetry-switch drift
- distinguish responsibility as Ψ/X self-binding from responsibility-to-authority
- distinguish parity as reciprocity-binding from parity-to-exit

15.9 D module scenic questions

- Was D violated in enactment, not what kind of person is this?
- Who had realistic capacity to secure D under the given Ω and Θ ?
- Was the violation avoidable given actual P and A?
- Did publicness amplify costs, expose burdens, or distort the reading?
- Was outer-form naming used for protection and accountability, or converted into shaming?
- Was asymmetry activation marked, bounded, and re-bound into Σ/Ψ ?
- Was parity used to coordinate reciprocity, or to exit responsibility?
- Was responsibility carried as self-binding, or converted into authority?

15.10 Guard clause

PMS-SEX outer-form naming does not automatically license public accusation. MIP critique does not retroactively convert PMS-SEX structural descriptions into moral verdicts. Path-cost, disturbance, stabilization burden, asymmetry-switch drift, parity-to-exit, responsibility-to-authority, or cost-topology mismatch remains PMS-SEX configuration-language unless a separate evaluative framework is explicitly and legitimately docked.

16. Limits, glossary, and one-line chapter markers

16.1 Structural limits

PMS-SEX models	PMS-SEX does not model
Scenes and enactments; frames and frame stability; asymmetries and cost layouts; sexual cost topology; repetition, trajectories, and irreversibility; non-events; outer legibility; publicness overlays; drift; stabilization; exit conditions; asymmetry-switch drift; parity-to-exit; responsibility-to-authority; cost-topology mismatch; operator profiles for possible MIP docking.	Persons; personality, disposition, or character; inner motives, drives, or experiential qualities; developmental histories or causal psychologies; sexual identity, orientation, or worth; individual responsibility beyond structural attribution; direct adulthood verdicts; maturity hierarchy; dignity hierarchy.

16.2 Scope guards

- Identical practice labels do not imply identical structure.
- Internal framing does not settle outer form.
- Public discourse does not exhaust scene legibility.
- Cost topology must be reconstructed scene by scene.
- Psychology is subordinated, not denied; it may refine only after structural reconstruction.
- Refusal of PMS terms does not automatically indicate denial, immaturity, pathology, or drift.
- PMS-SEX is not a how-to guide, risk-management manual, clinical authority, forensic authority, or taxonomy of identities / orientations.

16.3 Glossary highlights

Term	Meaning
Sexual cost topology	Scene-bound distribution of bodily, temporal, exposure-related, reputational, binding-related, exit-related, publicness-related, and responsibility-related costs. Not a score.
Asymmetry-specific responsibility	Self-binding required by a role-position's cost, power, exposure, exit, and externalization profile.
Adult sexual reciprocity	Unequal burdens need not be equal, but they must not be externalized.
EDEN/PFO asymmetry switch	Cross-domain PMS–EDEN reference for parity claimed in one register while asymmetry is activated in another.
Asymmetry-switch drift	Unmarked, repeatable asymmetry activation under real or invoked Ω/Θ pressure without re-binding into Σ/Ψ .
Parity-to-exit	Parity rhetoric used to deny additional responsibility under unequal sexual cost topology.
Responsibility-to-authority	Required self-binding under asymmetry converted into control, frame authority, protection entitlement, or governance.
Cost-topology mismatch	Declared parity, autonomy, non-binding status, or mutuality diverges from actual cost distribution.
Operator profile only	PMS-SEX records structural profiles; adulthood-relevant evaluation belongs to MIP docking.
MIP docking	Optional evaluative interface where critique questions must remain scene-bound, reversible, non-person-ranking, non-diagnostic, and D-preserving.

16.4 Chapter one-line markers

- **Ch. 4:** Asymmetry becomes concrete as sexual cost topology.
- **Ch. 14:** Modulators weight operator paths without typing persons.
- **Ch. 17:** Suspended self-binding suspends attribution; it does not remove Ψ from PMS.
- **Ch. 18:** Drift markers describe configuration dynamics, including switch drift, parity-to-exit, and responsibility-to-authority.
- **Ch. 19:** Viability requires Ω nameable, Θ real, X operative, Ψ not substituted, Λ tolerable, inner framing accountable to outer form, publicness proportionate, and cost topology not externalized.
- **Ch. 20:** Minimal psychology does not explain desire; it signals that repetition, accumulation, switch drift, and frame narrowing are no longer correcting themselves.

- **Ch. 21:** Dignity in sexual practice is how asymmetry is carried, not who someone is.
- **Ch. 22:** PMS-SEX explains how structures work; MIP explains when critique is legitimate.
- **Ch. 23:** PMS-SEX stops where other lenses begin: no psychology, taxonomy, moral rank, adulthood verdict, or advice.
- **Ch. 24:** Sexual cost topology is not a score. PMS-SEX records operator profiles; maturity-relevant evaluation belongs to MIP docking.

17. Structural tools, analysis checklist, and example schema

17.1 Operator table use

The operator table is descriptive only. It supports internal consistency checks and has no normative, diagnostic, person-classifying, or adulthood-evaluating function.

17.2 One-page structural map

The structural map compresses the PMS-SEX reading path: scene framing, impulse, non-events, attractor formation, asymmetry, temporality, recontextualization, distance, integration, self-binding, outer legibility, publicness, sexual cost topology, and possible MIP docking. It remains an orientation map, not a diagnostic tool.

17.3 Analysis checklist

Step	Title	Core checks
S1	Scene boundary	Define the scene through $\square$; keep readings configuration-bound and revisable; identify divergence between internal framing, outer legibility, publicness, and temporal carryover.
S2	Canonical dependency check	Do not alter PMS v1.3 spine; reduced signatures are shorthand; X , Σ , and Ψ dependencies remain intact; EDEN/PFO switch language is cross-domain reference only.
S3	Reduced operator signature	Select closest signature; record chapter reference; do not infer new dependency relation; treat cost topology and switch drift as overlay/profile handles.
S4	Inner / outer / public layer scan	Identify internal framing, outer legibility, publicness, and temporal carryover without letting one layer erase the others.
S5	Cost axis scan	Identify Ω gradients, Θ trajectory, body remainder, publicness, and sexual cost topology; stop if cost topology becomes score, dignity ranking, or maturity ranking.
S6	Distance and correction capacity	Check whether X is practically operative; whether Σ is reachable; whether outer-form awareness and switch clarification are possible without punishment.
S7	Drift marker scan	Check Ch. 18 markers and dynamic chains; record sexual drift triad as profile only where present.
S8	Switch drift scan	Ask whether asymmetry activation is marked, bounded, real, and re-bound; whether parity coordinates or exits responsibility; whether responsibility is self-binding or authority.
S9	Viability minimums	Apply Ch. 19 minimums, warning signals, Appendix D corridor, and adult sexual reciprocity principle.
S10	Path-cost guard	Disturbance, deviation, entropy, path-cost, or stabilization burden applies only to configuration dynamics.
S11	MIP docking guard	Shift adulthood-relevant or maturity-relevant language to MIP; PMS-SEX records operator profiles only.
S12	Escalation guard	If drift persists despite structural clarity, Ch. 20 alarm may activate. No motive explanation, diagnosis, ranking, or humiliating critique.

17.4 Example suite schema

Examples are scene-bound operator-readable vignettes. They are non-instructional, generic, abstracted, and non-identifying.

Required blocks

- Minimal vignette, scene-bound and non-identifying.
- Why this is repo-useful, structural focus only.
- Operator mapping with canonical spine and reduced signature where applicable.

- Inner / outer / public layer distinction.
- Operator costs / cost layout: Ω under Θ , including body/publicness interfaces where relevant.
- Sexual cost topology: bodily, exposure, reputational, binding, exit, publicness, and responsibility costs.
- Switch drift markers where relevant: asymmetry-switch drift, parity-to-exit, responsibility-to-authority.
- Typical drift markers, maximum two or three, non-moral and non-diagnostic.
- Viability minimums or warning signals where applicable.
- Adult sexual reciprocity readout where unequal burdens are central.
- Asymmetry-specific responsibility readout where role-position self-binding is central.
- MIP docking guard where maturity-relevant language is implicated.
- Path-cost guard where disturbance or entropy language appears.
- Validity gate reminder: $X + \text{reversibility} + D$.
- Readable structural closure: two to five sentences, non-instructional.

Optional blocks

- Cost-topology mismatch.
- EDEN/PFO sexual instantiation note.
- Operator-profile-only note.
- Publicness-as-overlay expansion.
- Non-capture note.

Forbidden in examples

- how-to guidance
- procedural sexual instruction
- risk optimization
- identifiable case narratives
- clinical interpretation
- motive attribution
- person ranking
- orientation taxonomy
- maturity ranking
- adulthood verdict from PMS-SEX alone
- dignity hierarchy
- moral verdicts

18. Final profile guard

PMS-SEX remains valid by staying within what it can responsibly say: not what persons are, but what configurations do over time. It reads sexual praxis as enacted configuration under frame, asymmetry, non-event, repetition, temporality, distance, integration, and self-binding. It permits hard claims about cost, drift, outer legibility, sexual cost topology, and consequence without converting those claims into person-status judgments.

18.1 Compressed rules

- no consequence-free sex
- no desire exempt from structural conditions
- no outer-form erasure by internal labels
- no publicness reduction
- no path-cost as person-worth
- no sexual cost topology as score
- no asymmetry switch as authority
- no parity-to-exit as reciprocity
- no responsibility-to-authority as care
- no operator profile as direct adulthood verdict
- no critique through humiliation
- no maturity hierarchy
- no dignity hierarchy
- no taxonomy where only configuration-language is warranted
- no total capture where the scene exceeds the grammar

18.2 Adult reciprocity guard

Adult sexual reciprocity does not require equal burdens. It requires that unequal burdens not be externalized through unmarked asymmetry activation, parity-to-exit, or responsibility-to-authority.

18.3 MIP docking guard

PMS-SEX may record operator profiles and drift markers. It may not directly evaluate person-adulthood. Adulthood-relevant critique belongs to MIP docking and must remain scene-bound, reversible, non-person-ranking, non-diagnostic, and D-preserving.

Final marker profile closure

PMS-SEX remains valid by staying within what it can responsibly say: not what persons are, but what configurations do over time.
